It provides drag-and-drop placement, resizing and formatting of widgets. Features Axure RP supports prototyping rich Internet Applications by assigning the desired interface behavior (e.g. displaying or hiding an item) in response to actions such as mouse clicks or touch gestures. [1] Axure RP generates HTML web sites for preview and team collaboration, as well as Microsoft Word documents as output for production documentation. Axure RP can also connect to other tools and services such as Slack and Microsoft Teams to collaborate. Axure RP is also able to automatically adjust and move smoothly from macOS to Windows. For security reasons, prototypes can be sent with password protection to ensure full disclosure. Users create custom controls by combining existing widgets and assigning actions in response to events such as OnClick, OnMouseOver, and OnMouseOut, or touch gestures such as pinch and swipe. For example, interface panels can have a set of states, each of which is enabled by clicking an item such as a tab, a list box item, or an action button [2] Commercialization. The current version of Axure RP 9 software is available as a subscription or perpetual license for commercial use. There are three versions: Pro, Team, and Enterprise. The Pro product is available free of charge for students and teachers and with discounts for educational institutions. [3] The Pro version adds documentation features, including layout control, output to Microsoft Word and Excel, and support for team projects. External links Official Retrieved from Axure RP has received a facelift in the form of Axure RP 8. Axure RP, along with Sketch and Invisionapp, is one of the most popular software for prototyping and wireframing, so it's only natural for UX designers to see Always. This one came across Axure RP on version 8. Some UX specialists will be more excited than others, but one thing is certain: Most of Coda's UX designers love the update. Changes introduced in Axure RP 8 include: An updated workspace and a New Features and Features New Features and Features Improvements and Updates to AxShare Sharing System 1. Updated Workspace and Toolbar Workspace One of the most prominent changes in Axure RP 8 is the updated workspace, which makes Axure look cleaner and more confusing overall. This effect has been achieved by significantly reducing the icons as well as by updated icon styles. These changes may introduce some minor hiccups into the UX Designer workflow—at least until they find out which icons now contain the features they use the most. Toolbar The toolbar has seen a number of changes in version 8, especially the aesthetic diversity. Include changes: Title has been removed from selection mode to list each action of each tool. It integrates very well with the now standard FontAwesome library (also new in Axure RP 8) to help designers create their own custom icons in Axure for use in their designs. It's relatively easy to use, but it can take some getting used to. Page pane The title of the sitemap has been changed to pages in the new update. Although this is not too much of a change, the wording is more relevant to the functionality of this section of Axure RP 8. In the new update, some of the pop-out arrow icons, add pages, add folders, and search have been changed and moved. Some of the icons have even been completely eliminated, such as moving page up/down, deleting indent page and page. Some of the eliminated icons were nice to have and could even be a downside of the new Axure RP update. Having the symbols for some of these actions was very courteous. They made it easier and faster to move or delete pages. Axure RP 8 Pages Panel Libraries Panel The library panel may reappear to experienced users of Axure RP. However, this is not the case. It's just a rebranding of what UX designers know as widgets. For most designers, this will probably feel like a change that has been a long time coming. Axure RP 8 Libraries Panel Other changes to the Library panel include: Moved and changed icons for options and Search Visual changes for selected libraries always make libraries with a drop-down list for easy switching (two thumbs up! Our designers had about 6 or 7 libraries in Axure RP 7 and they always complained that they didn't know where they were New elements that are Library: redesigned boxes, buttons and links, ellipse, markup widgets -- snapshot arrows, sticky notes, circle and drop markers. (Finally an ellipse widget! No longer drag a rectangle, and then select the ellipse shape!) Added a built-in FontAwesome library Adding the Font Awesome library was a very smart decision for Axure RP 8 and one that has been waiting a long time since professionals have been using it in their prototypes for several years. The best thing about the FontAwesome library is that designers no longer need to link the CSS font link within the web fonts and generate the HTML code or ensure that the font is installed on their computer because it is now standard in Axure RP 8. Inspector Panel In line with the trend to change bad name systems to something more logical, Axure RP 8 has changed what was formerly known as widget interactions and notes to Inspector. Axure RP 8 Inspector Panel Other changes include: Tabs have been reformatted and restructured into three tabs such as properties, notes, and style, making it much easier to find what you're looking for. The styling functionality has been integrated into widget styles, namely: page orientation, background colors and images (previously at the bottom). Interactions have been integrated into the Properties tab (previously in another section). Page interactions were added to this section instead of from below, as in Axure RP 7. The frustrating thing about this addition is that you need to click ON in the background to view the page section, whereas before you could simply choose what you need from below. Notes has got its own tab, along with the ability to customize fields for different sections and types of notes. In addition, new formatting features, such as .B the ability to add direct links to related documents, are now possible. New is the ability to select adaptive views per page. In version 7, this feature was hidden, but as responsive design became more and more popular, Axure decided to make this a major feature. Finally! Page outline As before the trend, the title has changed from widget manager to outline: page. The Search, expand panel, and filter icons have been moved and changed, while the add state, duplicate state, move up, move down, and delete icons have been deleted (although the keystrokes still work). Axure RP 8 Page Outline Functionality has changed a little to display all widgets on the active page instead of interactions. In addition, new sorting and filtering options are now available in version 8, including the ability to sort from front to back and from back to front. 2. New features Features in Axure RP 8 Group Interactions Multiple widgets can now be grouped into group properties that include interaction and actions. This means that it is no longer necessary to Panels on the page! Actions and animations From Axure RP 8, concurrent actions can now be triggered. New actions have also been added, including: Flip, Set Size and Fire Event, Set Opacity and Rotate Around an Anchor. These actions are useful for setting up multiple actions for one item (or multiple items at the same time). Now, designers can easily resize an item, add (limited) flip interactions, and trigger multiple page events simultaneously with a single interaction. When you create wireframes in Axure RP for an eCommerce site, we recommend using this new great feature as it can be very helpful. New events New events are: OnRotate, OnSelected, OnUnSelected, OnResize (dynamic panels) and OnItemResize (repeater). Of these, perhaps the most useful events are OnSelected and OnUnSelected, simply because they get rid of the need when using statements differently in the conditions and cases. Snapshot Widget New features in Snapshot include the ability to view full-page screenshots, screenshots on the inside page, and screenshots of master events. This is because the snapshots are automatically updated when the referenced page is updated. This is a great feature for flows and sitemaps, or even to display a second state without having to create Case 1 and Case 2. Repeater A few small interaction updates have been made to repeaters, but the main advantage is product images and image galleries, which are now much easier to create. Box Border & Corner Radius UX designers can now design custom boxes in Axure RP 8. This feature is one of the favorites among Coda UX designers because they often want to create tabs where only the top corners have a corner radius, while the bottom frame is not displayed. Flowcharts and Connections Another great addition to the flowcharts is the New Image feature. Connecting images to flows creates a more seamless look and easily improves location flow. New endings and curved connection points can now be added to shapes and images. Prior to the update, UX designers were limited to one type of point at a time. This allows a lot of customization. Printing configurations When your UX team prints your wiremodels, this functionality is extremely useful. Paper sizes can now be changed, print guides displayed, multiple print configurations added, and pages selected for printing. Coda's

UX team usually presents its wireframes only digitally during customer meetings, so this new feature wasn't too intoxicating. However, teams that are similar to us could start changing their way due to this new functionality. It be useful when you brainstorm sessions and write notes directly on the printed pages. 3. AxShare in Axure RP 8 HTML Sidebar The new HTML sidebar provides quick access to notes, file details, and stakeholder discussions. It has been redesigned to give more of a modern look and feel. Personally, I am a big fan of the Discussions or Notes tab on the new HTML sidebar just because it's always hidden. You must click the tab to see the sections. – Allie Serd, UX Designer, Codal Inc. Widget Libraries Before this update, A library would have to be created at Codal and loaded from our Google Drive, which we share between teams. With this new feature, libraries can now be loaded directly from AxShare. This ensures that everyone on the UX team always has the latest version without having to work together to find out which designer has which version. Team Projects With SVN still available, the new option to post team projects directly to AxShare is one of the biggest new features, especially for large UX teams working on the same files. This feature is probably my all-time favorite simply because before this update, no matter what the circumstances, the original owner was the only person who could publish a file. Now my team can work together on a file and anyone can publish it.– Allie Serd, UX Designer, Codal Inc. Conclusion: New Face, Same Personality The new Axure RP 8 is cleaner and more aesthetically pleasing for the eyes. Although the core features of Axure RP 8 are similar to those in RP 7, the platform's UX and user interface have been significantly improved. Not only does it look better, but it allows ux teams to collaborate more complexly, while making it easier for teams that aren't in the same office to participate in the same wireframe. The new Axure RP 8 is great, but there are still some things missing from the platform that the UX world would like to see in a wire framing platform. An important thing that our Axure specialists here at Codal would like to see in the next Axure RP update is the ability of commenting directly on the wire frame instead of placing comments in the left sidebar. Redpen.io is a great example of a platform with which you can do this. Another bug that still needs to be updated is that you cannot apply an interaction to multiple buttons at the same time. Instead, you need to click on each button and change the action individually. We are interested to hear from you! What do you think of Axure RP 8 and would like to see in the next update? Would you like to know more? Are you interested in the intersection between UX and UI Design? The online courses on UI Design Patterns for Successful Software and Design Thinking: The Beginner's Guide can give you the skills you need. When you attend a course, you will receive an industry-recognized certificate to advance your career. However, if you want to refresh the basics of UX and usability, try the online course Experience (or any other design theme). Good luck on your learning journey! Travel! Travel!
